PJM Estimated ORDCs

- **The ORDC estimation method presented by PJM in May was a straightforward adaptation of the method used by ERCOT.**
- **The ORDC means that PJM will buy more than current synchronized reserve levels and pay higher prices for synchronized reserves.**
- **Used within the energy and reserve joint optimization, the MMU expects the estimated ORDCs would lead PJM to carry more online capacity than it has historically.**
- **The implication is not only a change to price formation, but also a change to operations.**

Estimated ORDCs and Historic Reserves

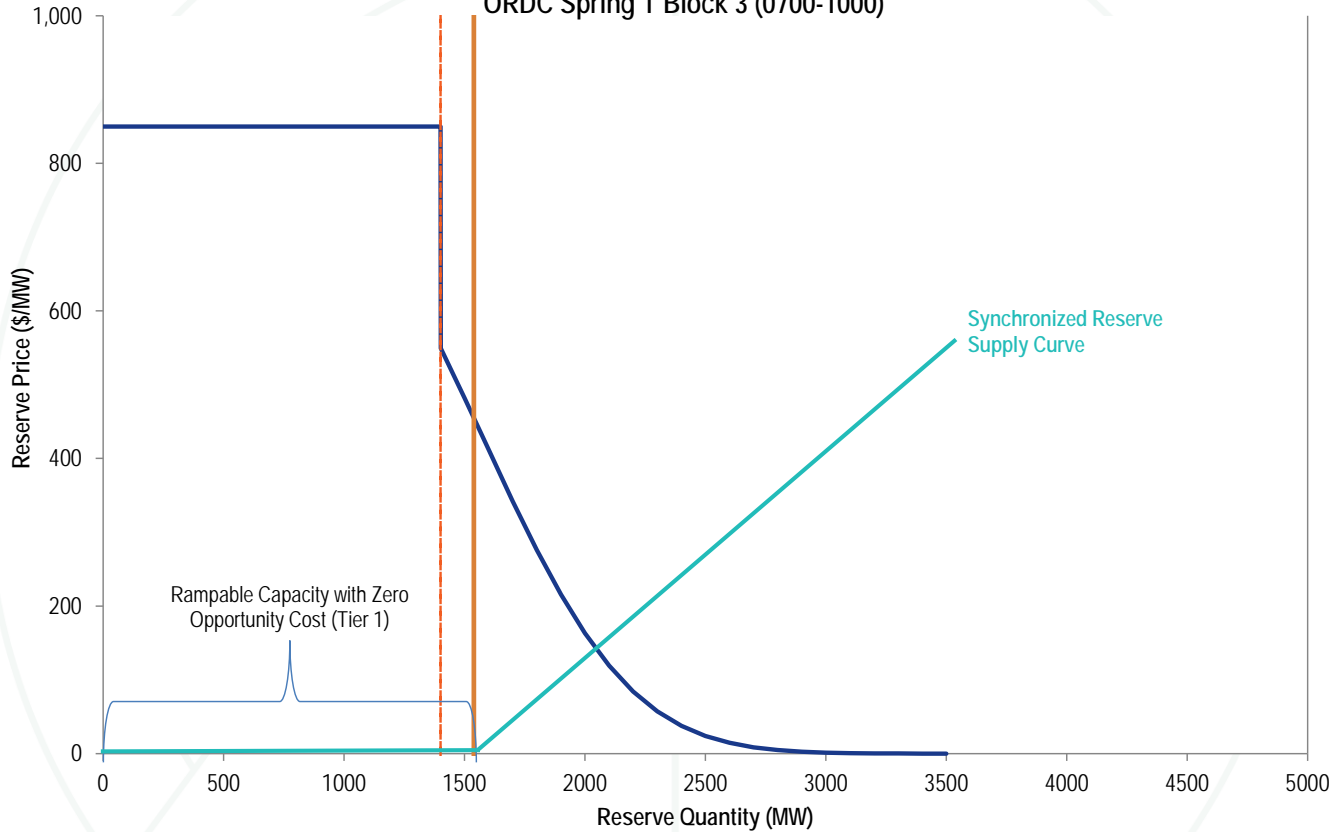

- **The following graphs plot the PJM ORDC estimates provided at the May EPFSTF meeting.**
- **The MMU added historic synchronized reserve levels:**
 - **2015 through 2017**
 - **By season and time block**
 - **Five minute pricing solution synchronized reserve levels**
 - **Minimum, Maximum**
 - **Mean, Median**
- **The actual historic reserve requirement may vary from the MRR (minimum reserve requirement) in the plotted curve.**

ORDC Spring T Block 3 (0700-1000)
